Version 1

## Outer Taillight Condensation Is Normal

### APPLIES TO

All models

### DESCRIPTION

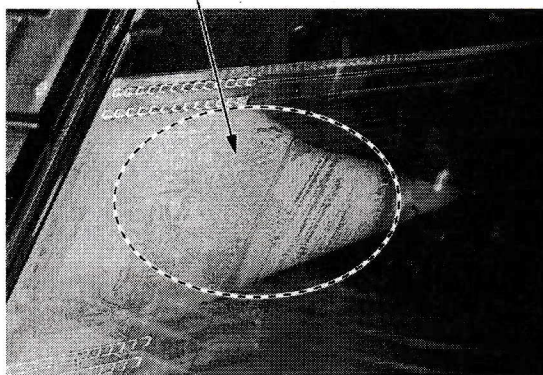

Condensation in the outer taillight.

NOTE: This does **not** apply to an inner taillight on a trunk lid or hatch, nor a headlight.

Outer taillights are designed with ventilation features which allow air to enter the taillight. When the air inside of a taillight is warmer than the air outside, condensation can form on the inside lens of the taillight. This characteristic is normal and will clear naturally.
